

**IN THE CLAIMS:**

Please amend the claims as follows:

1. (Previously Presented) A cement shoe assembly for use in a wellbore comprising:

a tubular housing for disposal at an end of a tubular string, the housing having an enlarged inner diameter portion at the lowermost end of the housing and a drillable material disposed in the enlarged inner diameter portion; and

a drillable cement shoe portion disposed in the housing, the cement shoe portion in selective fluid communication with the tubular string,

wherein the drillable material is predisposed to substantially fall away from the housing when drilled.

2-9. (Cancelled)

10. (Original) The cement shoe assembly of claim 1, wherein the drillable cement shoe includes a valve member providing the selective communication with the tubular.

11. (Previously presented) A method of connecting a first tubular to a second tubular in a wellbore, the method comprising:

providing a cement shoe assembly having a housing and drillable cement shoe, the assembly disposed at a lower end of a first tubular string;

cementing the housing in the wellbore by injecting cement into an annular area defined by the housing and a borehole therearound;

drilling the cement shoe to leave only the housing thereof, the housing having an area of increased inside diameter at a lower end thereof;

aligning an upper portion of the second tubular with the area of increased inside diameter of the housing; and

expanding the upper portion of the second tubular by placing a radially expansive force upon an inner wall thereof, until the second tubular is in frictional contact with the

area of increased inside diameter of the housing and the outer diameter of the housing is not substantially expanded.

12. (Original) A cement shoe assembly for completion of a lined wellbore, the assembly comprising:

a housing for disposal at a lower end of a tubular string, the housing having a first upper inside diameter and a lower, enlarged inside diameter;

a drillable shoe portion in the housing including:

a bore extending longitudinally therethrough for the selective passage of fluids;

drillable material disposed in an annular area between the bore and the inside surface of the housing, the drillable material selected from a list including cement, concrete, sand and composite materials;

a nose portion disposed on a lower end of the housing, the nose portion having at least one aperture therethrough; and

formations formed in the drillable material adjacent the lower, enlarged inside diameter portion of the housing, the formations constructed and arranged to urge the material away from the housing when the cement shoe is drilled.

13. (Previously presented) A connection made in a wellbore between two tubulars, the connection comprising:

a first tubular having an inside surface, the first tubular having an upset portion at its lower end wherein the first tubular decreases in wall thickness; and

a second tubular having an expanded diameter in contact with the inside surface of the first tubular, whereby the diameter of the first tubular is not substantially expanded and an inside diameter of both tubulars is substantially the same.

14. (Original) The connection of claim 13, wherein the inside surface of the first tubular is an enlarged diameter portion.

15-16. (Cancelled)

17. (Previously presented) A method of forming a connection in a wellbore between a first, larger diameter tubular and a second, smaller diameter tubular without enlarging the diameter of the first tubular, comprising:

providing the first tubular with an area of enlarged inside diameter at a lower end thereof, wherein a wall of the first tubular decreases in thickness at the area of enlarged inside diameter;

locating the second tubular coincident with the enlarged inside diameter of the first tubular; and

expanding the second tubular through use of radial force on an inside surface thereof, whereby

an outer surface of the second tubular expands outward to meet and frictionally contact the enlarged inside diameter portion of the first tubular without substantially enlarging the diameter of the first tubular.

18. (Previously presented) A method of forming a connection between two wellbore tubulars comprising the steps of:

placing a first wellbore tubular having an outer diameter and a first end in proximity of a second wellbore tubular, the second wellbore tubular having an enlarged inner diameter portion formed by reducing a thickness of a wall of the second wellbore tubular at a second end, wherein the enlarged inner diameter portion is proximate the second end;

inserting the first end of the first tubular into the second end of the second tubular; and

expanding the first end of the first tubular, such that the outer diameter comes into connecting contact with the enlarged inner diameter portion.

19. (Previously presented) A cement shoe assembly for use in a wellbore, comprising:

a tubular housing for disposal at an end of a tubular string, the housing having an enlarged inner diameter portion located at a lower end of the housing;

a drillable cement shoe portion disposed in the housing, the cement shoe portion in selective fluid communication with the tubular string; and

a drillable, nose portion disposed on a lower end of the housing to facilitate insertion of the assembly into the wellbore and having a bore therethrough substantially coincident with a bore of the cement shoe portion,

wherein the drillable material of the assembly adjacent the enlarged inner diameter portion of the housing is constructed and arranged to become dislodged from the housing when the shoe is drilled with a drill having an outer diameter smaller than the enlarged inner diameter portion of the housing and the drillable material is weakened by voids formed therein that terminate at an inner surface of the enlarged inner diameter portion of the housing.

20. (Previously presented) The cement shoe assembly of claim 19, wherein the voids formed in the drillable material each extend radially from a point proximate a central tubular member to the inner surface of the enlarged diameter portion.

21. (Previously presented) The cement shoe assembly of claim 20, wherein some of the drillable material is a composite material.

22. (Previously presented) The cement shoe assembly of claim 21, wherein some of the composite material is fiberglass.

23. (Previously presented) A method of forming a connection in a wellbore between a first, larger diameter tubular and a second, smaller diameter tubular without enlarging the diameter of the first tubular, comprising:

providing the first tubular with an area of enlarged inside diameter at a lower end thereof, wherein the first tubular comprises a housing of a cement shoe;

locating the second tubular coincident with the enlarged inside diameter of the first tubular; and

expanding the second tubular through the use of radial force on the inside surface thereof, whereby

the outer surface of the second tubular expands outward to meet and frictionally contact the enlarged inside diameter portion of the first tubular without substantially enlarging the diameter of the first tubular.

24. (Previously presented) A method of forming a connection between two wellbore tubulars comprising the steps of:

placing a first wellbore tubular having an outer diameter and a first end in proximity of a second wellbore tubular having an enlarged inner diameter portion and a second end wherein the enlarged inner diameter portion is proximate the second end and the second tubular comprise a housing of a cement shoe;

inserting the first end of the first tubular into the second end of the second tubular; and

expanding the first end of the first tubular such that the outer diameter comes into connecting contact with the enlarged inner diameter portion.

25. (Previously presented) A connection made in a wellbore between two tubulars, the connection comprising:

a first tubular having an inside surface, wherein the inside surface is an enlarged inner diameter portion and the first tubular is a housing of a cement shoe; and

a second tubular having an expanded diameter in contact with the inside surface of the first tubular, whereby the diameter of the first tubular is not substantially expanded and an inside diameter of both tubulars is substantially the same.

26. (Previously presented) The connection of claim 25, wherein the second tubular includes a string of tubulars, all of which have an expanded diameter.

27. (Previously presented) The method of claim 17, wherein a hydraulically operated expander tool applies the radial force to the inside surface of the second tubular.

28. (Previously presented) The method of claim 18, wherein an expander tool with radially extendable members is used to expand the first end of the first tubular.

29. (Previously presented) A method of forming a connection in a wellbore between two tubulars, comprising:

providing a second tubular and a first tubular having an enlarged inner diameter portion, the first tubular having a wall having a first thickness at a first portion and a second thickness at a second portion;

locating the second tubular coincident with the enlarged inner diameter portion of the first tubular; and

expanding the second tubular radially, such that an outer diameter of the second tubular frictionally contacts the enlarged inner diameter portion.

30. (Previously presented) The method of claim 29, wherein the outer diameter of the second tubular frictionally contacts the enlarged inner diameter portion of the first tubular without substantially enlarging the diameter of the first tubular.

31. (Previously presented) The method of claim 29, wherein the second thickness is less than the first thickness.

32. (Previously presented) The method of claim 31, wherein the second portion is at the enlarged inner diameter portion.

33. (Previously presented) The method of claim 31, wherein the second portion is at a lower end of the first tubular.

34. (Previously presented) The method of claim 31, wherein the enlarged inner diameter portion is at a lower end of the first tubular.

35. (Previously presented) A connection made in a wellbore between two tubulars, comprising:

a first tubular having an inside surface, the first tubular having a wall having a first thickness at a first portion and a second thickness at a second portion; and

a second tubular having an expanded diameter in contact with the inside surface of the first tubular at the second portion, whereby the diameter of the first tubular is not substantially expanded and an inside diameter of both tubulars is substantially the same.

36. (Previously presented) The connection of claim 35, wherein the second thickness is less than the first thickness.

37. (Previously presented) The connection of claim 36, wherein the second portion of the wall of the first tubular is an enlarged inner diameter portion.

38. (Previously presented) The connection of claim 36, wherein the second portion is at a lower end of the first tubular.

39. (Previously Presented) A cement shoe assembly for use in a wellbore comprising:

a tubular housing for disposal at an end of a tubular string, the housing having an enlarged inner diameter portion at the lowermost end of the housing;

a drillable cement shoe portion disposed in the housing, the cement shoe portion in selective fluid communication with the tubular string; and

a drillable, nose portion disposed on the lowermost end of the housing to facilitate insertion of the assembly into the wellbore, the nose portion having a bore therethrough substantially coincident with a bore of the cement shoe portion.

40. (Previously Presented) The cement shoe assembly of claim 39, wherein a drillable material of the assembly adjacent the enlarged inner diameter portion of the housing is constructed and arranged to become dislodged from the housing when the shoe is drilled with a drill having an outer diameter smaller than the enlarged inner diameter portion of the housing.

41. (Previously Presented) The cement shoe assembly of claim 40, wherein the drillable material is weakened by voids formed therein.

42. (Previously Presented) A cement shoe assembly for use in a wellbore comprising:

a tubular housing for disposal at an end of a tubular string, the housing having an enlarged inner diameter portion at the lowermost end of the housing;

a drillable cement shoe portion disposed in the housing, the cement shoe portion in selective fluid communication with the tubular string; and

a drillable material adjacent the enlarged inner diameter portion of the housing constructed and arranged to become dislodged from the housing when the shoe is drilled with a cutting tool having an outer diameter smaller than the enlarged inner diameter portion of the housing.

43. (Previously Presented) The cement shoe assembly of claim 1, wherein the drillable material outside a reach of a cutting tool is predisposed to fall away from the housing upon passing the cutting tool through the housing.

44. (Currently Amended) A cement shoe assembly for use in a wellbore comprising:

a tubular section for disposal at an end of a tubular string, the lowermost end of the tubular section having an enlarged inner diameter portion, the enlarged inner diameter portion having a length at least as large as the enlarged inner diameter; and

a drillable cement shoe portion disposed in the tubular section, the cement shoe portion in selective fluid communication with the tubular string.

45. (Previously Presented) The cement shoe assembly of claim 44, wherein the tubular section includes at least a first inner diameter and a second inner diameter, the first inner diameter larger than the second inner diameter, and the lowermost end including the second inner diameter.

46. (Previously Presented) The cement shoe assembly of claim 44, wherein an upper end of the tubular section is connected to a lower end of the tubular string.

47. (Previously Presented) The cement shoe assembly of claim 46, wherein the upper end of the tubular section is threaded to the lower end of the tubular string.

48. (Previously Presented) The cement shoe assembly of claim 44, wherein the enlarged inner diameter portion is between first and second ends of the tubular section.

49. (Previously Presented) The cement shoe assembly of claim 44, wherein the tubular section comprises a first thickness and a second thickness, the enlarged inner diameter portion having the second thickness.
